THE PROBLEM

Retail and institutional traders often struggle to react fast enough to volatile markets and to manage multiple assets efficiently. Manual execution leads to:

- Missed opportunities during rapid price changes
- Emotion-driven and inconsistent trading decisions
- Limited ability to backtest or simulate strategies
- Delayed responses to global market events

Developing, testing, and executing trading strategies manually is time-consuming, complex, and error-prone.

THE SOLUTION

Our software provides an end-to-end intelligent trading platform that automates the entire trading lifecycle.

Users can:

- Create strategies using simple English prompts processed by the AI agent.
- Backtest these strategies using real historical data. Deploy them for live or paper trading through Binance and Alpaca integrations.
- Receive instant Telegram notifications whenever trades are executed. Analyse performance and sentiment in one central dashboard.

By combining AI-driven sentiment analysis and natural language interaction, technical indicators, and automated execution, our solution enables traders to make faster, more informed, and data backed decisions.

SOFTWARE & TOOLS

THE PROCESS

Our team divided the project into key components:

- Strategy and evaluation engine - takes user strategies, calculates indicators in real time and provides buy/sell/hold signals
- AI Natural language parser - Converts natural language instructions into executable strategies
- Backtesting Engine - Simulates historical performance of strategies
- Paper & Live Trading Engine - Executes trades in real or simulated environments using binance and alpaca brokers
- Telegram Notification System - Sends instant trade alerts and updates
- Social Sentiment Analysis - Measures market sentiment by analysing supplied text and assists with decision making during strategy creation
